Abstract: PURPOSE: To improve desilverability and to enable rapid processing by incorporating a specified compound in at least one of a photosensitive silver halide emulsion layers and the silver salt of a compound having a bleach promoting action in at least one of photographic constituent layers.

CONSTITUTION: At least one of the photosensitive silver halide emulsion layers of the silver halide photographic sensitive material contains the compound capable of reacting with the oxidation product of a color developing agent and releasing a compound capable of scavenging said product or its precursor, typified by formulae I and II and the like, and at least one of the photographic constituent layers contains the silver salt of the compound having the bleach promoting action, thus permitting desilverability to the improved and rapid processing to be carried out.
